DETAILED ACTION

Claim Rejections - 35 USC § 103

- 1. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
 - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 2. Claims 1-6, 11-13 and 14 are rejected under 35 U.S.C. 103(a) as being unpatentable over Applicant's admitted prior art(AAPA) in view of Weber (U.S. Patent 3,923,151) and Henkel et al.(U.S. Patent 3,974,716)

AAPA, as found on pages 2-4 of the applicants specification, discloses the known method of adjusting a treatment machine in which a transporting chain for transporting object to be treated is guided in loops through at least one treatment station in a machine housing and driven at least at two locations by drive which in a normal operation synchronized and adjusted chain length relative to one another so that the transporting chain in its guides is neither tightly pulled nor compressed.

But this known method fail to teach the steps of: selecting (more than) two drives which follow one another in a forward direction of the transporting chain; asynchronously driving selected drives, so that a chain portion located therebetween is tightly pulled or compressed by producing a length difference, and measuring a parameter which is dependent from a drive moment of one or selected drives; when parameter reaches or exceeds a fixed value, operating the drive asynchronously for reducing the previously produced length difference by a predetermined amount; subsequently maintaining the adjusted relative position of the both drives

relative to one anther, with synchronous operation to the drives; electrically controlling the drives, and performing the method automatically by a programmable microprocessor.

Weber teaches the steps of: Accelerating and decelerating (asynchronously) driving selected drives, so that a chain portion located therebetween is tightly pulled or compressed by producing a length difference, and measuring a parameter which is dependent from a drive moment of one or selected drives; when parameter reaches or exceeds a fixed value, operating the drive accelerating and decelerating (asynchronously) for reducing the previously produced length difference by a predetermined amount; subsequently maintaining the adjusted relative position of the both drives relative to one anther, with synchronous operation to the drives; electrically controlling the drives, and performing the method automatically by a programmable microprocessor. See Abstract; col. 3, lines 18-22; col. 6, lines 36-40.

Henkel et al. teach the step of selecting (more than) two drives which follow one another in a forward direction of the transporting chain. See col.1, lines 15-39; col. 2, lines 3-11.

It would have been obvious to one of ordinary skill in the art at the time the invention was made to employ the steps of: selecting (more than) two drives which follow one another in a forward direction of the transporting chain, as taught by, Henkel et al. and further employ asynchronously driving selected drives, so that a chain portion located therebetween is tightly pulled or compressed by producing a length difference, and measuring a parameter which is dependent from a drive moment of one or selected drives; when parameter reaches or exceeds a fixed value, operating the drive asynchronously for reducing the previously produced length difference by a predetermined amount; subsequently maintaining the adjusted relative position of the both drives relative to one anther, with synchronous operation to the drives; electrically

controlling the drives, and performing the method automatically by a programmable microprocessor, as taught by Weber on the method of AAPA so as to maintain a predetermined tension in the chain.

3. Claim 7 is rejected under 35 U.S.C. 103(a) as being unpatentable over AAPA/Weber/Henkel et al. as applied to claim1 above, and further in view of Viebach et al. (U.S. Patent 5,730,436).

AAPA/Weber/Henkel et al. teach the limitations as cited above with the exception of the steps of providing the drives with rotary sensors for determination of their relative angular position, storing ;their angular positions; and performing the synchronization of an electrical path by controlling the drives.

Viebach et al. teach the steps of providing the drives with rotary sensors (S1,S2) for determination of their relative angular position, storing ;their angular positions; and performing the synchronization of an electrical path by controlling the drives. See claim 4.

It would have been obvious to one of ordinary skill in the art at the time the invention was made to employ the steps of the steps of providing the drives with rotary sensors for determination of their relative angular position, storing ;their angular positions; and performing the synchronization of an electrical path by controlling the drives, as taught by Viebach et al. on the method of AAPA/Weber/Henkel et al. so as to adjust the positions of the chain.

4. Claims 8-10 are rejected under 35 U.S.C. 103(a) as being unpatentable over AAPA/Weber/Henkel et al. as applied to claim1 above, and further in view of Pelzer (U.S. Patent 3,712,457).

AAPA/Weber/Henkel et al. teach the limitations as cited above with the exception of the

step of measuring current consumption of the electric motors as parameter which are dependent from drive moments.

Pelzer teaches the step of measuring current consumption of the electric motors as parameter which are dependent from drive moments. See col. 2, lines 10-17: claim 2.

It would have been obvious to one of ordinary skill in the art at the time the invention was made to employ the step of measuring current consumption of the electric motors as parameter which are dependent from drive moments, as taught by Pelzer on the method of AAPA/Weber/Henkel et al. so as to maintain a predetermined tension in the chain.

Response to Arguments

5. Applicant's arguments filed July 13, 2001 have been fully considered but they are not persuasive. See the new Office Action.
